#### FINAL DETAILED ACTION

## Response to Arguments

1. Applicant's arguments with respect to claims 1, 2, 4-8, and 11-26 have been considered but are most in view of the new ground(s) of rejection.

### Claim Rejections - 35 USC § 112

- 2. The following is a quotation of the second paragraph of 35 U.S.C. 112:
  - The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 3. Claims 17 and 18 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The claims include '...the identifier...'. It is not clear if the claim is referring to the first, second, or third identifier.

### Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 5. Claim 1, 2, 4-6, 8, 11, and 14 are rejected under 35 U.S.C. 102(e) as being anticipated by U.S. Pat. No. 6,463,414 by Su et al, hereinafter Su.

Regarding claim 1, Su discloses a method for managing a packet switched, centralized conference call between a plurality of terminals (i.e. telephony devices) (Fig. 1, Fig. 2:

participants 1-2) (col. 3, line 60 – col. 4, line 7), said method comprising at a conference call server (Fig. 2: 200):

receiving streams of data packets from each of the plurality of terminals participating in a conference call (col. 4, line 62 - col. 5, line 18), wherein each data packet includes either voice data or background noise information (col. 8, lines 37-43) and an identifier (i.e. priority assignment) associated with the respective terminal providing the data packet; determining, based on the received data packets, if any of the terminals participating in the conference call are currently providing voice data (col. 7, lines 46-53), and, if so, identifying each of the terminals currently providing voice data (col. 7, line 40 – col. 8, line 3); mixing voice data and background noise information included in the received streams of data packets to generate encoded combined data (col. 8, lines 60-65) and inserting the encoded combined data into outbound data packets together with indicia (i.e. priority assignment; Fig. 5, 560) identifying any terminal that provided any voice data associated with the encoded combined data for each outbound data packet; and streaming the outbound data packets to the terminals (i.e. using output channels to stream data packets to the terminals; Fig. 2: 212, 216, 220) participating in the conference call (col. 4, line 51 – col. 5, line 18; Fig. 4; col. 8, line 35 – col. 9, line 9).

Regarding claim 2, see col. 7, lines 40-53; Fig. 5, 560.

Regarding claim 4, see col. 7, lines 40-53 and col. 8, lines 37-43 and col. 8, line 52 - col. 9, line 14; Fig. 5, 560.

Regarding claim 5, see col. 7, lines 40-53; Fig. 5, 560.

Regarding claim 6, see col. 7, line 40 - col. 8, line 3; Fig. 5, 560.

Regarding claim 8, see col. 7, line 40 - col. 8, line 3; Fig. 5, 560.

Regarding claim 11, Su discloses a method for identifying an active terminal (col. 7, line 40 - col. line 3) of a plurality of terminals (i.e. telephony devices) (Fig. 1, Fig. 2: participants 1-2) (col. 3, line 60 - col. 4, line 7) participating in a conference call:

Page 4

sending a first data packet from a first terminal participating in a conference call to a conference call server (Fig. 2, 200), wherein the first data packet includes background noise information and an identifier (i.e. priority assignment) associated with the first terminal (col. 8, line 37 – col. 9, line 14; col. 7, line 54 – col. 8, line 3); receiving a second data packet from the conference call server at the first terminal, wherein the second data packet includes the background noise information mixed with voice data from a second terminal participating in the conference call and an active terminal identifier associated with the second terminal (col. 6, lines 31-49; col. 7, line 54 – col. 8, line 3; Fig. 4; col. 8, lines 52-65; Fig. 5, 560); and presenting the active terminal identifier and an indicator at the first terminal, wherein the indicator indicates that the second terminal sent the voice data to the conference call server (col. 7, lines 40-45 and lines 54-65).

Regarding claim 14, Su discloses a method for managing a packet switched, centralized conference call between a plurality of terminals (i.e. telephony devices) (Fig. 1, Fig. 2: participants 1-2) (col. 3, line 60 – col. 4, line 7), the method comprising:

decoding a first data packet received from a first terminal of a plurality of terminals participating in a conference call at a conference call server (Fig. 2, 200), wherein the first data

packet includes voice data-and an identifier (i.e. priority assignment) associated with the first terminal (col. 4, line 51 – col. 5, line 18; col. 7, lines 40-53; Fig. 5, 560);

decoding a second data packet received from a second terminal of the plurality of terminals participating in the conference call at the conference call server, wherein the second data packet includes background noise information (col. 8, lines 37-65; Fig. 4);

determining that the first data packet includes the voice data; mixing the decoded voice data and the decoded background noise information; inserting the mixed voice data and background noise information into a third data packet together with the identifier (Fig. 4; Fig. 5; col. 8, lines 52-65); and sending the third data packet to the plurality of terminals participating in the conference call (col. 4, line 51 – col. 5, line 18; col. 8, lines 52-65).

## Claim Rejections - 35 USC § 103

- 6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 7. Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Su, as applied to claim 1, in further view of U.S. Pat. No. 6,466,550 by Foster et al, hereinafter Foster.

Regarding claim 7, a method according to claim 1, wherein Su does not disclose said conference call is based on the Real-time Transport Protocol (RTP), wherein said data packets are RTP packets, wherein said identifiers associated to said terminals (13) are Synchronization Source (SSRC) identifiers, and wherein said identifiers are included by said conference call

server (12) in said new data packets to a field provided in a packet header for a Contributing Source (CSRC) list.

Foster discloses a method for managing a packet switched, centralized conference call between a plurality of terminals (Fig. 2; see Abstract), said method comprising at a conference call server (Fig. 2: 44, 46):

receiving data packets from all terminals participating in said conference call, which data packets include either voice data or background noise information (e.g. other parties talking) as well as an identifier associated to the respective terminal providing said voice data or said background noise information;

determining based on said received data packets at least one terminal currently providing voice data, if any, among said terminals participating in said conference call;

mixing said received voice data and said received background noise information (col. 5, line 49 – col. 6, line 7; col. 9, line 56 – col. 10, line 15; col. 10, lines 27-36; col. 11, lines 8-19).

Foster further discloses said conference call is based on the Real-time Transport Protocol (RTP), wherein said data packets are RTP packets, wherein said identifiers associated to said terminals (13) are Synchronization Source (SSRC) identifiers, and wherein said identifiers are included by said conference call server (12) in said new data packets to a field provided in a packet header for a Contributing Source (CSRC) list (col. 8, line 6 – col. 7, line 67).

It would have been obvious to one of the ordinary skill in the art at the time the invention was made to modify the method of Su to include a RTP protocol, SSRC identifiers, and a CSRC list as taught by Foster. One of ordinary skill in the art would have been lead to make such a

modification to provide a conference call application in the Internet utilizing the RTP and the SSRC and CSRC fields in RTP packets.

8. Claims 12 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Su, as applied to claim 11, in further view of Foster.

Regarding claim 12, a method of claim 11, wherein Su does not disclose said conference call is based on the Real-time Transport Protocol (RTP).

Foster discloses a method for managing a packet switched, centralized conference call between a plurality of terminals (Fig. 2; see Abstract), said method comprising at a conference call server (Fig. 2: 44, 46):

receiving data packets from all terminals participating in said conference call, which data packets include either voice data or background noise information (e.g. other parties talking) as well as an identifier associated to the respective terminal providing said voice data or said background noise information;

determining based on said received data packets at least one terminal currently providing voice data, if any, among said terminals participating in said conference call;

mixing said received voice data and said received background noise information (col. 5, line 49 – col. 6, line 7; col. 9, line 56 – col. 10, line 15; col. 10, lines 27-36; col. 11, lines 8-19).

Foster further discloses said conference call is based on the Real-time Transport Protocol (RTP), wherein said data packets are RTP packets (col. 8, line 6 – col. 7, line 67).

It would have been obvious to one of the ordinary skill in the art at the time the invention was made to modify the method of Su to include a RTP protocol as taught by Foster. One of

ordinary skill in the art would have been lead to make such a modification to provide a conference call application in the Internet utilizing RTP.

Regarding claim 13, a method of claim 12, wherein Foster discloses first data packet and the second data packet are RTP packets (col. 8, line 6 – col. 7, line 67).

9. Claims 15-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Su, as applied to claim 14, in further view of Foster.

Regarding claim 15, the method of claim 14, wherein Su does not disclose the received second data packet further includes a second identifier associated with the second terminal.

Foster discloses a method for managing a packet switched, centralized conference call between a plurality of terminals (Fig. 2; see Abstract), said method comprising at a conference call server (Fig. 2: 44, 46):

receiving data packets from all terminals participating in said conference call, which data packets include either voice data or background noise information (e.g. other parties talking) as well as an identifier associated to the respective terminal providing said voice data or said background noise information;

determining based on said received data packets at least one terminal currently providing voice data, if any, among said terminals participating in said conference call;

mixing said received voice data and said received background noise information (col. 5, line 49 – col. 6, line 7; col. 9, line 56 – col. 10, line 15; col. 10, lines 27-36; col. 11, lines 8-19).

Foster further discloses a received second data packet further includes a second identifier associated with a second terminal (col. 3, lines 24-37; col. 6, lines 8-46).

Application/Control Number: 10/613,986

Art Unit: 2614

It would have been obvious to one of the ordinary skill in the art at the time the invention was made to modify the method of Su to include a data packet with identifier information as taught by Foster. One of ordinary skill in the art would have been lead to make such a modification to provide a conference call application in which the source of an input channel to a conference call is identified to another participant.

Regarding claims 16-21, see Foster: col. 3, lines 24-37; col. 6, lines 8-46.

10. Claims 22-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Su in view of Foster.

Regarding claim 22, Su discloses a method for managing a packet switched, centralized conference call between a plurality of terminals (i.e. telephony devices) (Fig. 1, Fig. 2: participants 1-2) (col. 3, line 60 – col. 4, line 7), the method comprising:

receiving a stream of packets from a plurality of terminals participating in a voice over Internet protocol (VoIP) conference call (col. 1, lines 18-22) at a conference call server (Fig. 2, 200) (col. 4, line 62 - col. 5, line 18); decoding the received stream to extract background noise information and any voice data (col. 8, lines 37-43);

determining if the decoded stream includes any voice data; if the decoded stream includes voice data, extracting an identifier (i.e. priority assignment) associated with a first terminal from which the decoded voice data is extracted (col. 7, line 40 – col. 8, line 3); mixing the decoded voice data, if any, with the decoded background noise information; inserting the mixed voice data and background noise information and a header that includes the extracted identifier, if any, into an outbound packet; and streaming the outbound packet to the plurality of terminals participating in

the VoIP conference call (col. 6, lines 31-49; col. 7, lines 61-65; Fig. 5, 560; Fig. 4; col. 8, line 37 – col. 9, line 14).

Su discloses receiving and transmitting streams of packets in a VoIP conference call.

However, Su does not disclose said conference call is based on the Real-time Transport Protocol (RTP).

Foster discloses a method for managing a packet switched, centralized conference call between a plurality of terminals (Fig. 2; see Abstract), said method comprising at a conference call server (Fig. 2: 44, 46):

receiving data packets from all terminals participating in said conference call, which data packets include either voice data or background noise information (e.g. other parties talking) as well as an identifier associated to the respective terminal providing said voice data or said background noise information;

determining based on said received data packets at least one terminal currently providing voice data, if any, among said terminals participating in said conference call;

mixing said received voice data and said received background noise information (col. 5, line 49 – col. 6, line 7; col. 9, line 56 – col. 10, line 15; col. 10, lines 27-36; col. 11, lines 8-19).

Foster further discloses said conference call is based on the Real-time Transport Protocol (RTP), wherein said data packets are RTP packets (col. 8, line 6 – col. 7, line 67).

It would have been obvious to one of the ordinary skill in the art at the time the invention was made to modify the method of Su to include a RTP protocol as taught by Foster. One of ordinary skill in the art would have been lead to make such a modification to provide a conference call application in the Internet utilizing RTP.

Application/Control Number: 10/613,986 Page 11

Art Unit: 2614

Regarding claims 23-26, see Foster: col. 3, lines 24-37; col. 6, lines 8-46.

#### Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

- 12. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. See PTO-892 Form.
- 13. Any response to this action should be mailed to:

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Or faxed to:

(571) 273-8300 (for formal communications intended for entry)

Or call:

(571) 272-2600 (for customer service assistance)
